

BEYOND THE EXPECTED.

Sc2400 EXCLUSIVE FEATURES

3 Grab Handles

An exclusive Cub Cadet Yanmar feature allows for easier and safer entry/exit of the wide platform.

Fully Hydraulic Power Steering

Delivers power from the hydraulic valve body to the front steering link through hydraulic lines. Makes for less steering wheel kickback in rough terrain, with or without loader, for easier, safer operation. It also lowers the cost for owners throughout the life of the tractor by having less moving parts.

Positive Position 3-Point Control

Allows for greater control of rear- and mid-mounted attachments by allowing the operator to set attachments precisely where needed; it's big tractor performance in a smaller tractor package.

Dual Hydraulic Pumps – 7.0 GPM Total

A feature normally found only on larger compact tractors, separate hydraulic pumps deliver a more efficient flow of hydraulic fluid and result in smooth hydraulic response at low- or high-speed operation. And because the drive system and implements are powered separately, the Sc2400 handles attachments with less loss of power.

Front-Mounted Worklights

An exclusive Cub Cadet Yanmar feature allows for brighter and safer operation of all front-mounted attachments for dusk-to-dawn operations.

Powerful Clean-Burning 24 HP* Diesel Engine

The Sc2400 engine is a 3-cylinder liquid-cooled diesel engine with an advanced combustion chamber. The air charge enters the chamber at a higher volume and with greater pressure, creating a better fuel mixture. Plus, the mouth of the chamber is specially designed to begin the swirl process before the fuel mixture enters the chamber. All of these features create a more powerful combustion which gives you the torque you need and power you want to handle any job. This allows the engine to run cleaner and efficiently.

Reverse Mounted Engine

Pulls clean air from the operator station across the engine for cooling, reducing the amount of dirt and debris that enters the engine compartment and reduces hot air blowing back on the operator. This increases the operator's comfort and reduces service intervals of the engine.

Shift-On-The-Go® Range Control

This feature allows the operator to change ranges without stopping. It makes better use of the tractor's power to increase productivity. Not having a neutral gear makes the tractor safer and easier to operate, and with less moving parts, it lowers the cost of ownership over the life of the tractor.

Actuated Hydraulic PTO Engagement

The easy-to-engage electric PTO switch actuates a servo, allowing hydraulic fluid to enter the PTO clutches slowly. This results in smoother engagement of the attachment and extends the life of the system, lowering the cost of ownership over the life of the tractor. This feature is ideal for customers transitioning from a lawn or garden tractor and helps them become comfortable with the operation of a PTO.
